

## AT A GLANCE

# AOS10 AT A GLANCE

Next-generation, Distributed Operating System for Aruba Enterprise Wi-Fi

ArubaOS 10 (AOS10) is the distributed network operating system working with Aruba Central that controls Aruba Access Points (APs) and optional gateways. With its flexible architecture, network teams can deliver reliable and secure wireless connectivity for small offices, mid-sized branches, and even large campus environments. Working in tandem with Aruba Central, AOS10 provides the WLAN management and control to deliver greater scalability, security, and AI-powered optimization.

## EMERGING MARKET TRENDS

Two trends are shaping network management: cloud-based architectures and artificial intelligence for IT operations (AIOps). According to IDC, half of all new deployments between now and 2022 will offer cloud-based management<sup>1</sup> in order to simplify operations, accelerate innovation, and provide greater scalability. Organizations are also relying more on AI and machine learning (ML) to help automate, streamline and improve IT and business decision making. This new focus on AI/ML to improve operator efficiency and user experience is expected to increase dramatically. According to Gartner, 30% of enterprises will adopt AI-enabled tools to augment traditional monitoring approaches by 2023, up from 2% in 2018.<sup>2</sup>

With these market trends in mind, AOS10 has been designed to deliver scalability, greater reliability, embedded AI and machine learning optimization, and simplified licensing and consumption. It also provides greater flexibility to support new use cases such as IoT. AOS10 works with Aruba Central as a core component of Aruba's ESP strategy to convert data at the Edge into meaningful business and IT outcomes.

## EASE OF DEPLOYMENT AND MAINTENANCE

With its cloud-native, microservices architecture, AOS10 provides greater scalability and accelerated innovation for wireless networks. It works with Aruba Central to deliver WLAN control and management services that are unified

## KEY BENEFITS

- Simplify the deployment and upgrade of wireless networks using a unified operating system that meets the needs of remote workers, branch offices, and large campus environments
- Optimize radio frequencies and deliver reliable and high-performing connectivity with AI-automation and machine learning insights
- Provide the highest levels of security with policy enforcement across wired and wireless environments and secure segmentation
- Unify the management of wired, wireless, and SD-WAN using Aruba Central to create a single pane of glass as part of Aruba's Edge Services Platform (ESP)
- Future-proof your wireless investment using a cloud-native, microservices architectural model

across branch, campus, and remote networks. Enterprises can opt to use gateways for even greater scalability, security, and manageability.

With AOS10, onboarding, configuring, and provisioning APs and gateways is simpler and requires no manual CLI configuration or maintenance windows. Once the AP is plugged in, the device connects and receives its running configuration from the cloud using zero touch provisioning, which allows remote workers and offices to onboard and configure wireless connectivity without any on-site IT support. It's also easier to use Apple, Google, and third-party services with multicast DNS proxy capabilities to prioritize services and add policy controls.

To avoid downtime or loss of service caused by upgrades, Aruba offers Live Upgrade functionality. Live Upgrade reduces maintenance windows and ensures continuous wireless operations.

## INTELLIGENT OPTIMIZATION

To optimize radio frequencies and deliver reliable and high-performing connectivity, AOS10 includes advanced AI and machine learning capabilities that keep Wi-Fi networks performing at peak levels. For critical unified communications applications, AOS10 provides a consolidated view of how voice and video applications are performing with insights into potential performance and capacity issues and prioritization of UCC traffic for higher quality of experience.

### Optimize Client Connectivity

To improve the experience for roaming mobile users, **ClientMatch** monitors the radio frequency environment around each client and uses advanced analytics to dynamically provide ongoing band steering and spectrum load balancing to enhance the experience for every client in the network. ClientMatch automatically reassigns APs as needed to avoid sticky client issues, which occur when the client remains tethered to a specific AP despite low signal levels.

### Automate RF Management

To support growth in client device density and in data volumes, **AirMatch** uses machine learning techniques to provide automated radio frequency optimization. By analyzing the entire wireless network, AirMatch determines the optimum radio configuration and enables the network to automatically adapt in real time to changing RF conditions such as high noise and radar. It also adjusts for higher density, co-channel interference, and coverage gaps.

### Deliver SLA-Grade Application QoS

With **Air Slice**, organizations can provide application assurance to their users that goes beyond the traditional capabilities of airtime fairness. After the SLAs are configured, Air Slice monitors network usage, automatically allocates radio resources, and dynamically adjusts radio resources as new users connect and applications sessions begin or end. Air Slice helps guarantee stringent application performance for latency-sensitive and high-bandwidth uses including voice and video.

## Eliminate Cellular Gaps

Enterprises can automatically and securely authenticate guests with public cellular network credentials on private enterprise Wi-Fi networks using **Air Pass**<sup>3</sup>. Built on the technical foundations of Passpoint® and Wi-Fi Calling, Air Pass creates a roaming network across the Aruba enterprise customer footprint, extending cellular coverage and enhancing the visitor and subscriber experience to deliver a great experience for your guests while reducing costs and management overhead for DAS.

## AI-Powered Automation

AIOps capabilities delivered through Central include AI Insights to automatically surface and diagnose issues by using dynamic baselining and anomaly detection; AI Search to pinpoint help documentation and guide remediation steps to minimize guesswork; and AI Assist to collect diagnostics, alert IT, and automatically generate service tickets.

## BUILT-IN SECURITY

AOS10 extends the security capabilities in Wi-Fi 6 (802.11ax) such as WPA3 And Enhanced Open for secure guest access to strengthen enterprise security postures. Built-in deep packet inspection classifies thousands of applications for granular, per-app traffic enforcement, allowing IT to block, prioritize, and rate-limit bandwidth for an individual or groups of apps. Web Content Classification classifies websites by content category and rates them by reputation and risk score, enabling IT to block malicious sites to help prevent phishing, DDoS, botnets, and other common attacks.

## Policy Enforcement and Secure Segmentation

To improve security and ease of management, IT can centrally configure and automatically enforce role-based policies that define proper access privileges for employees, guests, contractors, and other user groups—no matter where users connect on wired and WLANs. **Dynamic Segmentation** eliminates the time consuming and error-prone task of

managing complex and static VLANs, ACLs, and subnets by dynamically assigning policies and keeping traffic secure and separated.

**MultiZone** architecture provides data separation for multi-tenancy, guest/visitor access, IoT devices, and other use cases. As the name implies, MultiZone allows each zone to be configured and managed separately with individual role-based access and policy enforcement per zone to meet the specific policy requirements of that zone. A single AP can connect to multiple gateways to tunnel traffic for isolation so that there is no need to deploy additional access points or deploy and manage another wireless network.

## SIMPLIFIED, FLEXIBLE CONSUMPTION

Cloud-native AOS10 is included with Aruba Central subscription-based licenses, which are purchased on a per-device basis for APs and Gateways. Customers can also purchase subscription licenses on a per-device basis for switches in Central. Licenses are available in 1-, 3-, 5-, 7-, and 10-year increments, making it easy for customers to align requirements for AIOps, security, and other desired management features. Foundation licenses provide all primary enterprise features and functionality; while advanced licenses include all foundational features plus enhanced AIOps, security and other premium features to deliver an end-to-end solution for managing and optimizing enterprise networks. APs starting with 3xx 802.11ac Wave 2 and newer and 7xxx Series Gateways are supported with AOS10.<sup>4</sup>

## GETTING STARTED

Our next-generation, distributed operating system, AOS10, is available in early access today for use with Aruba Central. For more information on how to get started with AOS10 to take advantage of AI-powered automation, built-in security, and seamless connectivity, contact your Aruba or partner sales representative.

<sup>3</sup>Air Pass is currently available in the U.S. only.

<sup>4</sup>There can be a slight lag time in support for new APs and gateways in Central.
