

HPE Aruba Networking ClearPass Policy Manager Upgrade Service

Service benefits

- Reduce the time required by internal IT resources
- Mitigate delays in deployment
- Verify the new deployment and migration was successful
- Support evolving technologies
- Mitigate security vulnerabilities

HPE Aruba Networking ClearPass Policy Manager (CPPM) is a powerful policy management platform that plays a crucial role in securing modern networks. It provides robust network access control with granular role-based policies for authentication, authorization, continuous monitoring, and enforcement. Ensuring your CPPM is up to date is essential for maintaining security, functionality, and overall stability in your IT infrastructure.

Why is it crucial for CPPM to be on the current version?

- 1. Security vulnerabilities:** All software systems can have weaknesses or vulnerabilities. These may allow cyber attackers to exploit the server, compromise data, or gain unauthorized access. HPE Aruba Networking ClearPass Policy Manager operates on Linux which is now being used in devices we use daily including televisions, automobiles, and watches. When attacks on Linux occur, the impact could be devastating. Staying current on CPPM ensures access to required patches so that your organization doesn't become a victim of the next cyberattack.
- 2. Optimal functioning:** Up-to-date ClearPass servers ensure that they can store, send, and receive data effectively over the network. If CPPM is not current, you could experience unexpected downtime, leading to disruptions in services.
- 3. Risk mitigation:** Ensuring CPPM is updated helps minimize risks such as data loss, reduced productivity, and security vulnerabilities.
- 4. High stakes:** Unlike patching individual devices, keeping CPPM updated is much more critical because it serves entire groups of users, network hardware, and critical functions within an IT environment.

The HPE Aruba Networking CPPM Upgrade Service is a packaged HPE Aruba Networking Professional Services offering that provides you with technical assistance to upgrade your CPPM cluster from 6.9.0+ to 6.11.X — including migrating settings, licenses, and security certificates to the new deployment.

Service planning

Conduct service planning meetings with you to share service delivery requirements and prerequisites. We will help collect and review information to confirm that all prerequisites have been met.

Design

Assist you in completing the ClearPass information document for the current ClearPass cluster architecture and review pre-installation requirements.

Environment preparation

Help you back up the existing ClearPass cluster and help bootstrap the new servers for CPPM deployment.

Deployment

Assist you with building and migrating to the new ClearPass cluster, configuring settings, and restoring licenses and certificates.

Verification

Provide a standard ClearPass system verification checklist and help you verify the new deployment was successful.

Ordering

Please use these part numbers to order this service:

Description	Part number
HPE Aruba Networks CPPM Upgrade Service	H43BBA1
Add up to one (1) physical or up to two (2) virtual ClearPass nodes*	H40LRA1

*This service is intended only for customers with 1 CPPM cluster and up to 2 CPPM nodes but migration of additional nodes may be added.

For more information on this service or larger deployments, please contact your HPE Aruba Networking account manager or authorized resale partner.

Benefits of HPE Aruba Networking Professional Services

Realize the full business value of your technology investments with service intelligence and proven HPE Aruba Networking engineering experts. Our services are designed to help you successfully design, build, and operate your HPE Aruba Networking solution as part of your business platform.
